

## Flow meter for bulk solids

- Contactless measurement
- Use in pneumatic conveyance and free fall
- Independent of the transport speed
- Easy calibration

## Area of application

The DYNAmas is a measuring device for determining the mass throughput of free flowing bulk materials. Powder, dust or granules that are transported in free fall or in pneumatic conveyor systems can be measured online reliably and without contact.

## Advantages

- process and quality assurance ensured by reliable throughput measurement
- use in free fall and pneumatic conveyance
- low overall height, easy integration into existing systems
- simple product calibration with calibration assistant
- no influence from moving components in the vicinity
- optional output of speed and concentration
- large measuring range, also suitable for lower product concentrations
- large selection of sizes
- switchable direction of flow

## Functionality

The device simultaneously measures the bulk solids concentration as well as the speed of solids. The mass throughput is calculated with these two values as well as the given inner pipe diameter and output via the DYNAcon evaluation unit.

**Concentration:** Using the capacitive measuring principle, the DYNAmas generates a homogeneous electromagnetic field. Bulk material that is transported through the sensor has a higher dielectric constant than air and thus increases the measured capacitance of the field. The change in capacity is proportional to the bulk material concentration in the measuring tube. The calibration can be done either by completely filling the sensor tube with bulk material or by reference weighing.

**Speed:** The particles are recorded at two sensors a defined distance apart; a determination of the transit time by means of a correlation calculation gives the speed in m/s. Since this is an absolute time measurement, no calibration is necessary.

The separate DYNAcon evaluation unit is equipped with a four-line LCD display and function keys. The following outputs and interfaces are available:

2x analogue output (4 ... 20 mA),  
3x relay output.

## Technical specifications

Power supply	19 ... 31 VDC, max. 10 W
CAN bus	Cable length max. 1000 m
Output via CAN bus	With DYNAcon: Mass throughput, speed, concentration, error, simulation value, limit value status
CAN bus transmission rate	40 kBaud
Measurement accuracy (typical)	1 ... 3%
Damping	1 ... 30 s
Temperature (ambient)	-40 ... 60°C (40 ... 140°F)
Temperature (process, standard)	max. 130°C (266°F)
Pressure	10/16 bar, opt. up to max. 64 bar (900 lbs)
Materials (electronics housing)	Die-cast aluminium
Materials (sensor tube)	See order code
International Protection Rating	IP68 (EN 60529)
Interference immunity	According to EN 61326-1

Subject to changes.

## Certificates

The Ex version of the DYNAmas can be used in the following zones:  
 In the pipe: Zone 20  
 Environment: Zone 1 or 21

### Ex1-21 versions:

Gas: II 2G Ex db eb IIC T4 Gb  
 Dust: II 2D Ex tb IIIC T130°C Db IP68

Gas: Ex db eb IIC T4 Gb  
 Dust: Ex tb IIIC T130°C Db IP68

### Ex20-21 versions:

Gas: No explosive gas atmosphere allowed  
 Dust inside the sensor: II 1D Ex ta IIIC T155°C Da IP68  
 Dust outside the sensor: II 2D Ex tb IIIC T130°C Db IP68

Gas: No explosive gas atmosphere allowed  
 Dust inside the sensor: Ex ta IIIC T155°C Da IP68  
 Dust outside the sensor: Ex tb IIIC T130°C Db IP68

## System set-up

- 1 Two 20 mA outputs for velocity and concentration.
- 2 Power supply of the DYNAcon communication unit.
- 3 Power supply of the sensor.
- 4 CAN bus cable:
  - To the sensor: Configuration
  - From the sensor: Measurements, simulation values, error messages.
- 5 Sensor.
- 6 Counter flanges (usually not included in the scope of delivery).
- 7 DYNAcon communication unit.

Dimensions, unless otherwise stated, in mm.

Subject to changes. Different sizes and pressure levels on request.

## Counter flanges

We will provide you with drawings for the required counter flanges. If required, we will be happy to supply you with the flanges.

Please specify the inside diameter and the material of the pipe.

## Installation

- 1 Inlet section.
- 2 Outlet section.

The DYNAmas can be used both in free fall and in pneumatic conveyor systems.

Installation in inclined pipelines is also possible.

With regard to the installation of the DYNAmas in the conveyor pipe, the direction of flow through the device is not relevant, as it can easily be adjusted in the software if necessary (A <> B).

The bulk material should be conveyed through the sensor as evenly as possible over the pipe

cross-section. Correspondingly, inlet and outlet sections must be observed. Your regional DYNA Instruments contact person will be happy to advise you on the optimal installation location.

The measuring device may have to be supported separately. Components such as rotary feeders or loading bellows must not be mounted directly on the measuring device without strain relief and vibrations must be avoided.

## Calibration of the sensor

In order to be able to record the mass throughput precisely, the flow meter must be calibrated to the bulk material. There are two methods available for this:

### Conveying method (Reference weighing)

Ideally, the calibration is carried out using reference weighing:

The product is transported through the sensor and then for example collected in a big bag and weighed.

Alternatively, a pre-weighed product quantity can also be conveyed through the sensor.

The determined mass is then entered via the DYNAcon communication unit.

The integrated calibration assistant automatically calculates the respective calibration point for the product concentration.

The speed measurement does not require calibration to the product. Only a few parameters have to be adapted to the process.

### Full pipe method

If reference weighing cannot be implemented, there is an alternative option to calibrate the DYNAmas:

A simple slide valve can be positioned under the DYNAmas to close the pipeline for calibration.

The DYNAmas must be completely filled with the product, if necessary through a flap in the pipeline above the device.

As soon as the device is filled with the product, the product concentration in the pipeline is assigned to the signal.

Alternatively, the device can also be pre-calibrated before it is installed.
